

# Real Number Formative assessment

---

**Question 1.** Without actually performing division, state which of these number will terminating decimal expression or non terminating repeating decimal expression

- a)  $7/25$
- b)  $3/7$
- c)  $29/343$
- d)  $6/15$
- e)  $77/210$
- f)  $11/67$
- g)  $15/27$
- h)  $11/6$
- i)  $343445/140$

## Solution

Those rational number which can be expressed in form  $x/2^m \times 5^n$  are terminating expression and those can not be are non terminating decimal expression

Terminating decimal: (a), (d)

Non terminating repeating decimal: (b), (c), (e), (f), (g), (h), (i)

**Question 2.** Using Euclid's theorem to find the HCF between the following numbers

- a) 867 and 225
- b) 616 and 32

**Solution**

a)

Using Euclid theorem

$$867 = 225 \times 3 + 192$$

$$225 = 192 \times 1 + 33$$

$$192 = 33 \times 5 + 27$$

$$33 = 27 \times 1 + 6$$

$$27 = 6 \times 4 + 3$$

$$6 = 3 \times 2 + 0$$

So solution is 3

b) 8

**Question 3.** Write 10 rational number between

- a) 4 and 5
- b)  $\frac{1}{2}$  and  $\frac{1}{3}$

**Question 4.** Represent in rational form.

- a) 1.232323....
- b) 1.25
- c) 3.67777777

**Question 5**

a) Prove that  $2 + \sqrt{3}$  is a irrational number

b) Prove that  $3\sqrt{3}$  is a irrational number

**Solution**

a) Let's take this as rational number

$$\frac{a}{b} = 2 + \sqrt{3}$$

Or

$$\frac{a-2b}{b} = \sqrt{3}$$

Since a rational number can't be equal to irrational number, our assumption is wrong

b) Let's take this as rational number

$$q = 3\sqrt{3}$$

$$\frac{q}{3} = \sqrt{3}$$

Since a rational number can't be equal to irrational number, our assumption is wrong

**Question 6 -True or False statement**

- Number of the form  $2n + 1$  where  $n$  is any positive integer are always odd number
- Product of two prime number is always equal to their LCM
- $\sqrt{3} \times \sqrt{12}$  is a irrational number
- Every integer is a rational number
- The HCF of two prime number is always 1
- There are infinite integers between two integers
- There are finite rational number between 2 and 3
- $\sqrt{3}$  Can be expressed in the form  $\frac{\sqrt{3}}{1}$ , so it is a rational number
- The number  $6^n$  for  $n$  in natural number can end in digit zero
- Any positive odd integer is of the form  $6m+1$  or  $6m+3$  or  $6m +5$  where  $q$  is some integer

**Solution**

- True
- True
- False, as it is written as 6
- True ,as any integer can be expressed in the form  $p/q$
- True
- False, There are finite integer between two integers
- False
- False
- False
- True

**Multiple choice Questions**

**Question 7** the HCF (a, b) = 2 and LCM (a, b) = 27. What is the value a X b

- a) 25
- b) 9
- c) 27
- d) 54

**Solution** (d)

$$\text{LCM} \times \text{HCF} = a \times b$$

**Question 8.**  $\sqrt{2} + 2$  Is a

- a) Non terminating repeating
- b) Terminating
- c) Non terminating non repeating
- d) None of these

**Solution** (c)

**Question 9** if a and b are co primes which of these is true

- a) LCM (a, b) = aXb
- b) HCF (a, b) = aXb
- c) a=br
- d) None of these

**Solution** a and b

**Question 10.** A rational number can be expressed as terminating decimal when the factors of the denominator are

- a) 2 or 5 only
- b) 2 or 3 only
- c) 3 or 5 only
- d) 3 or 7 only

**Solution** (a)

**Question 11.** if  $x^2 = 3$ ,  $y^2 = 9$ ,  $z^3 = 27$ , which of these is true

- a) x is a irrational number
- b) y is a rational number
- c) z is rational number
- d) All of the above

**Solution** (d)

**Short answer question****Question 12** Find the HCF and LCM of these by factorization technique

- a) 27,81  
b) 120,144  
c) 29029,580

**Solution (a)**

$$27 = 3 \times 3 \times 3$$
$$81 = 3 \times 3 \times 3 \times 3$$

$$\text{HCF} = 27$$
$$\text{LCM} = 81$$

b)

$$120 = 2 \times 2 \times 3 \times 2 \times 5$$
$$144 = 2 \times 2 \times 3 \times 2 \times 2 \times 3$$
$$\text{HCF} = 2^3 \times 3 = 24$$
$$\text{LCM} = 720$$

c)

$$29029 = 29 \times 13 \times 11 \times 7$$
$$580 = 29 \times 5 \times 4$$

$$\text{HCF} = 29$$
$$\text{LCM} = 29 \times 13 \times 11 \times 7 \times 4 \times 5 = 580580$$

**Question 13.** Find all the positive integral values of  $p$  for which  $p^2 + 16$  is a perfect square?**Solution**

$$p^2 + 16 = q^2$$
$$(q-p)(q+p) = 16$$

So we have

Case 1

$$q-p=8 \text{ and } q+p=2 \text{ which gives } p=3$$

Case 2

$$q-p=4 \text{ and } q+p=4 \text{ which gives } p=0$$

Case 3

$$q-p=2 \text{ and } q+p=8 \text{ which gives } p=3$$

So the answer is 3 only
