

## Application of Derivatives Exercise 6.2

---

### Question 1

Show that the function given by  $f(x) = 3x + 17$  is strictly increasing on  $\mathbb{R}$ .

#### Solution

$$f(x) = 3x + 17$$

Differentiating w.r.t  $x$

$$f'(x) = 3 > 0, \text{ in every interval of } \mathbb{R}.$$

Thus, the function is strictly increasing on  $\mathbb{R}$ .

### Question 2

Show that the function given by  $f(x) = e^{2x}$  is strictly increasing on  $\mathbb{R}$ .

#### Solution

$$f(x) = e^{2x}$$

Differentiating w.r.t  $x$

$$f'(x) = 2e^{2x} > 0, \text{ in every interval of } \mathbb{R}.$$

Hence,  $f$  is strictly increasing on  $\mathbb{R}$ .

### Question 3

Show that the function given by  $f(x) = \sin x$  is

- (a) strictly increasing in  $(0, \pi/2)$
- (b) strictly decreasing in  $(\pi/2, \pi)$
- (c) neither increasing nor decreasing in  $(0, \pi)$

#### Solution

The given function is  $f(x) = \sin x$ .

Differentiating w.r.t  $x$

$$f'(x) = \cos x$$

This material is created by <http://physicscatalyst.com/> and is for your personal and non-commercial use only.

(a) Since for each  $(0, \pi/2)$  we have  $\cos x > 0$

Hence,  $f$  is strictly increasing in  $(0, \pi/2)$

(b) Since for each  $(\pi/2, \pi)$ , we have  $\cos x < 0$

Hence,  $f$  is strictly decreasing in  $(\pi/2, \pi)$

(c) From the results obtained in (a) and (b), it is clear that  $f$  is neither increasing nor decreasing in  $(0, \pi)$ .

#### Question 4

Find the intervals in which the function  $f$  given by  $f(x) = 2x^2 - 3x$  is

(a) strictly increasing (b) strictly decreasing

#### Solution

$$f(x) = 2x^2 - 3x$$

Differentiating w.r.t  $x$

$$f'(x) = 4x - 3$$

Equating  $f'(x) = 0$ , we get

$$4x - 3 = 0$$

$$x = \frac{3}{4}$$

The point  $x = \frac{3}{4}$  divides the real line into two disjoint intervals, namely,  $(-\infty, \frac{3}{4})$ ,  $(\frac{3}{4}, \infty)$

In interval  $(-\infty, \frac{3}{4})$ ,  $f'(x) < 0$

Hence, the given function ( $f$ ) is strictly decreasing in interval  $(-\infty, \frac{3}{4})$

In interval  $(\frac{3}{4}, \infty)$ ,  $f'(x) > 0$

Hence, the given function ( $f$ ) is strictly increasing in interval  $(\frac{3}{4}, \infty)$

#### Question 5

Find the intervals in which the function  $f$  given by  $f(x) = 2x^3 - 3x^2 - 36x + 7$  is

(a) strictly increasing (b) strictly decreasing

#### Solution

This material is created by <http://physicscatalyst.com/> and is for your personal and non-commercial use only.

$$f(x) = 2x^3 - 3x^2 - 36x + 7$$

Differentiating w.r.t x

$$f'(x) = 6x^2 - 6x - 36$$

Equating  $f'(x) = 0$ , we get

$$6x^2 - 6x - 36 = 0$$

$$\text{Or } x = -2, 3$$

The points  $x = -2$  and  $x = 3$  divide the real line into three disjoint intervals i.e.,  $(-\infty, -2)$ ,  $(-2, 3)$  and  $(3, \infty)$

In intervals is positive  $(-\infty, -2)$ ,  $(3, \infty)$ ,  $f'(x) > 0$

while in interval  $(-2, 3)$ , is negative,  $f'(x) < 0$

Hence, the given function (f) is strictly increasing in intervals  $(-\infty, -2)$ ,  $(3, \infty)$

, while function (f) is strictly decreasing in interval  $(-2, 3)$ ,

### Question 6

Find the intervals in which the following functions are strictly increasing or decreasing:

(a)  $x^2 + 2x - 5$

(b)  $10 - 6x - 2x^2$

(c)  $-2x^3 - 9x^2 - 12x + 1$

(d)  $6 - 9x - x^2$

(e)  $(x + 1)^3(x - 3)^3$

### Solution

(a) We have,

$$F(x) = x^2 + 2x - 5$$

Differentiating w.r.t x

$$f'(x) = 2x + 2$$

Equating  $f'(x) = 0$ , we get

$$2x + 2 = 0$$

$$x = -1$$

Point  $x = -1$  divides the real line into two disjoint intervals i.e.,  $(-\infty, -1)$  and  $(-1, \infty)$

In interval  $(-\infty, -1)$ ,  $f'(x) < 0$

$f$  is strictly decreasing in interval  $(-\infty, -1)$

In interval  $(-1, \infty)$ ,  $f'(x) > 0$

$f$  is strictly increasing in interval  $(-1, \infty)$

(b) We have,

$$f(x) = 10 - 6x - 2x^2$$

Differentiating w.r.t  $x$

$$f'(x) = -6 - 4x$$

Equating  $f'(x) = 0$ , we get

$$-6 - 4x = 0$$

$$x = -3/2$$

The point divides the real line into two disjoint intervals i.e.,  $(-\infty, -3/2)$  and  $(-3/2, \infty)$

In interval  $(-\infty, -3/2)$ ,  $f'(x) > 0$

$f$  is strictly increasing for  $(-\infty, -3/2)$

In interval  $(-3/2, \infty)$ ,  $f'(x) < 0$

$f$  is strictly decreasing for  $(-3/2, \infty)$

(c) We have,

$$f(x) = -2x^3 - 9x^2 - 12x + 1$$

Differentiating w.r.t  $x$

$$f'(x) = -6x^2 - 18x - 12 = -6(x+1)(x+2)$$

Equating  $f'(x) = 0$ , we get

$$-6x^2 - 18x - 12 = 0$$

$$x^2 + 3x + 2 = 0$$

$$(x+1)(x+2) = 0$$

Or  $x = -1, -2$

Points  $x = -1$  and  $x = -2$  divide the real line into three disjoint intervals i.e.,  $(-\infty, -2)$ ,  $(-2, -1)$  and  $(-1, \infty)$

In intervals, i.e., when  $x < -2$  and  $x > -1$ ,  $f'(x) < 0$

$f$  is strictly decreasing for  $x < -2$  and  $x > -1$ .

Now, in interval  $(-2, -1)$  i.e., when  $-2 < x < -1$ ,  $f'(x) > 0$

$f$  is strictly increasing for  $-2 < x < -1$

(d) We have,

$$F(x) = 6 - 9x - x^2$$

Differentiating w.r.t  $x$

$$f'(x) = -9 - 2x$$

Equating  $f'(x) = 0$ , we get

$$x = -9/2$$

The point divides the real line into two disjoint intervals i.e.,  $(-\infty, -9/2)$  and  $(-9/2, \infty)$

In interval  $(-\infty, -9/2)$ ,  $f'(x) > 0$

$f$  is strictly increasing for  $(-\infty, -9/2)$

In interval  $(-9/2, \infty)$ ,  $f'(x) < 0$

$f$  is strictly decreasing for  $(-9/2, \infty)$

(e) We have,

$$f(x) = (x + 1)^3(x - 3)^3$$

Differentiating w.r.t x

$$f'(x) = 3(x+1)^2(x-3)^3 + 3(x+1)^3(x-3)^2$$

$$= 3(x+1)^2(x-3)^2 [x-3 + x+1]$$

$$= 6(x+1)^2(x-3)^2(x-1)$$

Equating  $f'(x) = 0$ , we get

$$x = -1 \text{ or } 3 \text{ or } 1$$

The points  $x = -1$ ,  $x = 1$ , and  $x = 3$  divide the real line into four disjoint intervals

i.e.  $(-\infty, -1)$ ,  $(-1, 1)$ ,  $(1, 3)$ , and  $(3, \infty)$

In intervals  $(-\infty, -1)$  and  $(-1, 1)$ ,  $f'(x) < 0$

$f$  is strictly decreasing in intervals  $(-\infty, -1)$  and  $(-1, 1)$ .

In intervals  $(1, 3)$  and  $(3, \infty)$ ,  $f'(x) > 0$

$f$  is strictly increasing in intervals  $(1, 3)$  and  $(3, \infty)$

### Question 7

Show that  $y = \log(1+x) - 2x/(2+x)$ ,  $x > -1$  is an increasing function of  $x$  throughout its domain.

### Solution

We have,

$$y = \log(1+x) - 2x/(2+x)$$

Differentiating w.r.t x

$$\frac{dy}{dx} = \frac{1}{1+x} - \frac{(2+x)2 - 2x(1)}{(2+x)^2} = \frac{x^2}{(2+x)^2}$$

Equating  $dy/dx = 0$ , we get

$$x^2 / (2+x)^2 = 0$$

or  $x = 0$  as  $x > -1$

Since  $x > -1$ , point  $x = 0$  divides the domain  $(-1, \infty)$  in two disjoint intervals i.e.,  $-1 < x < 0$  and  $x > 0$ .

When  $-1 < x < 0$ , we have  $dy/dx > 0$

Also, when  $x > 0$ , we have  $dy/dx > 0$

Hence, function  $f$  is increasing throughout this domain.

### Question 8

Find the values of  $x$  for which  $y = [x(x - 2)]^2$  is an increasing function.

### Solution

We have,

$$y = [x(x - 2)]^2$$

$$y = (x^2 - 2x)^2 = x^4 + 4x^2 - 4x^3$$

Differentiating w.r.t  $x$

$$dy/dx = 4x^3 + 8x - 12x^2$$

Equating  $dy/dx = 0$ , we get

$$4x(x^2 + 2 - 3x) = 0$$

$$4x(x-1)(x-2) = 0$$

The points  $x = 0$ ,  $x = 1$ , and  $x = 2$  divide the real line into four disjoint intervals i.e.,

$$(-\infty, 0), (0, 1), (1, 2), (2, \infty)$$

In intervals  $(-\infty, 0), (1, 2)$ ,  $dy/dx < 0$

$y$  is strictly decreasing in intervals,  $dy/dx$

However, in intervals  $(0, 1)$  and  $(2, \infty)$ ,  $dy/dx > 0$

$y$  is strictly increasing in intervals  $(0, 1)$  and  $(2, \infty)$ .

### Question 9

Prove that  $y = \frac{4 \sin \theta}{(2 + \cos \theta)} - \theta$  is an increasing function of  $\theta$  in  $[0, \pi/2]$

### Solution

We have,

$$y = \frac{4 \sin \theta}{(2 + \cos \theta)} - \theta$$

Differentiating w.r.t  $\theta$

$$\frac{dy}{d\theta} = \frac{(2 + \cos \theta)(4 \cos \theta) - (4 \sin \theta)(-\sin \theta)}{(2 + \cos \theta)^2} - 1 = \frac{8 \cos \theta + 4}{(2 + \cos \theta)^2} - 1$$

Equating  $dy/d\theta = 0$ , we get

$$\frac{8 \cos \theta + 4}{(2 + \cos \theta)^2} - 1 = 0$$

$$8 \cos \theta + 4 = (2 + \cos \theta)^2$$

$$8 \cos \theta + 4 = 4 + 4 \cos \theta + \cos^2 \theta$$

$$\cos^2 \theta - 4 \cos \theta = 0$$

$$\cos \theta (\cos \theta - 4)$$

Since  $\cos \theta \neq 4$ ,  $\cos \theta = 0$ .

$$\text{Or } \theta = \pi/2$$

Now,

$$\frac{dy}{d\theta} = \frac{8 \cos \theta + 4}{(2 + \cos \theta)^2} - 1 = \frac{8 \cos \theta + 4 - (4 + \cos^2 \theta + 4 \cos \theta)}{(2 + \cos \theta)^2} = \frac{4 \cos \theta - \cos^2 \theta}{(2 + \cos \theta)^2} = \frac{\cos \theta (4 - \cos \theta)}{(2 + \cos \theta)^2}$$

In interval  $(0, \pi/2)$  we have  $\cos \theta > 0$ . Also,  $4 > \cos \theta$ ,  $4 - \cos \theta > 0$

So  $dy/d\theta > 0$

Therefore,  $y$  is strictly increasing in interval  $(0, \pi/2)$

Also, the given function is continuous at 0 and  $\pi/2$

Hence,  $y$  is increasing in interval  $[0, \pi/2]$

### Question 10

Prove that the logarithmic function is strictly increasing on  $(0, \infty)$ .

#### Solution

$$F(x) = \log x$$

Differentiating w.r.t  $x$

$$f'(x) = 1/x$$

It is clear that for  $x > 0$ ,  $f'(x) > 0$

Hence,  $f(x) = \log x$  is strictly increasing in interval  $(0, \infty)$ .

### Question 11

Prove that the function  $f$  given by  $f(x) = x^2 - x + 1$  is neither strictly increasing nor strictly decreasing on  $(-1, 1)$ .

#### Solution

$$f(x) = x^2 - x + 1$$

Differentiating w.r.t  $x$

$$f'(x) = 2x - 1$$

Equating  $f'(x) = 0$ , we get

$$2x - 1 = 0$$

$$x = 1/2$$

The point divides the interval  $(-1, 1)$  into two disjoint intervals  $(-1, 1/2)$  and  $(1/2, 1)$

Now, in interval  $(-1, 1/2)$ ,  $f'(x) = 2x - 1 < 0$

Therefore,  $f$  is strictly decreasing in interval  $(-1, 1/2)$

However, in interval  $(1/2, 1)$ ,  $f'(x) = 2x - 1 > 0$

Therefore,  $f$  is strictly increasing in interval  $(1/2, 1)$

Hence,  $f$  is neither strictly increasing nor decreasing in interval  $(-1, 1)$ .

### Question 12

Which of the following functions are strictly decreasing on  $(0, \pi/2)$ ?

(A)  $\cos x$  (B)  $\cos 2x$  (C)  $\cos 3x$  (D)  $\tan x$

### Solution

(A) Let  $f(x) = \cos x$

$$f'(x) = -\sin x$$

In interval  $(0, \pi/2)$ ,  $f'(x) < 0$

So,  $f(x)$  is strictly decreasing in interval  $(0, \pi/2)$

(B) Let

$$F(x) = \cos 2x$$

$$f'(x) = -2 \sin 2x$$

for  $x$  in  $(0, \pi/2)$ ,  $2x$  would in  $(0, \pi)$ , So  $\sin 2x > 0$

and  $f'(x) = -2 \sin 2x < 0$

So,  $\cos 2x$  is strictly decreasing in interval  $(0, \pi/2)$

(C) Let  $f(x) = \cos 3x$

$$f'(x) = -3 \sin 3x$$

Equating  $f'(x) = 0$

$$\sin 3x = 0$$

Or  $x = \pi/3$  as  $x$  in  $(0, \pi/2)$

The point divides the interval into two disjoint intervals  $(0, \pi/3)$  and  $(\pi/3, \pi/2)$

For interval  $(0, \pi/3)$ ,  $f'(x) = -3 \sin 3x < 0$

So, it is strictly decreasing in interval  $(0, \pi/3)$

For interval  $(\pi/2, \pi/3)$ ,  $f'(x) = -3 \sin 3x > 0$

So, it is strictly increasing in interval  $(\pi/2, \pi/3)$ ,

This material is created by <http://physicscatalyst.com/> and is for your personal and non-commercial use only.

Hence, function is neither increasing nor decreasing in interval  $(0, \pi/2)$

(D) Let

$$f(x) = \tan x$$

$$f'(x) = \sec^2 x$$

for interval  $(0, \pi/2)$ ,  $f'(x) > 0$

So, function is strictly increasing in interval  $(0, \pi/2)$

Therefore, functions  $\cos x$  and  $\cos 2x$  are strictly decreasing in  $(0, \pi/2)$

**Hence, the correct answers are A and B.**

### Question 13

On which of the following intervals is the function  $f$  given by  $f(x) = x^{100} + \sin x - 1$  strictly decreasing?

(A)  $(0, 1)$

(B)  $(\pi/2, \pi)$

(C)  $(0, \pi/2)$

(D) None of these

### Solution

We have,

$$f(x) = x^{100} + \sin x - 1$$

$$f'(x) = 100x^{99} + \cos x$$

In interval  $(0, 1)$ ,  $f'(x) > 0$  as  $\cos x > 0$  and  $100x^{99} > 0$

Thus, function  $f$  is strictly increasing in interval  $(0, 1)$ .

In interval  $(\pi/2, \pi)$ ,  $\cos x < 0$  and  $100x^{99} > 0$  and  $100x^{99} > \cos x$ , So  $f'(x) > 0$

Thus, function  $f$  is strictly increasing in interval  $(\pi/2, \pi)$

In interval  $(0, \pi/2)$ ,  $\cos x > 0$  and  $100x^{99} > 0$ , So  $f'(x) > 0$

$f$  is strictly increasing in interval  $(0, \pi/2)$

This material is created by <http://physicscatalyst.com/> and is for your personal and non-commercial use only.

Hence, function  $f$  is strictly decreasing in none of the intervals.

**The correct answer is D.**

**Question 14**

Find the least value of  $a$  such that the function  $f$  given  $f(x) = x^2 + ax + 1$  is strictly increasing on  $(1, 2)$ .

**Solution**

We have,

$$f(x) = x^2 + ax + 1$$

$$f'(x) = 2x + a$$

Now, function  $f$  will be increasing in  $(1, 2)$ , if in  $(1, 2)$ ,  $f'(x) > 0$

$$2x + a > 0$$

$$2x > -a$$

$$x > -a/2$$

Now  $x$  lies in  $(1, 2)$ , So the least value of  $a$  such that

$$-a/2 = 1$$

$$a = -2$$

Hence, the required value of  $a$  is  $-2$ .

**Question 15**

Let  $I$  be any interval disjoint from  $(-1, 1)$ . Prove that the function  $f$  given by

$F(x) = x + 1/x$  is strictly increasing on  $I$ .

**Solution**

$$f(x) = x + 1/x$$

$$f'(x) = 1 - 1/x^2$$

$$1 - 1/x^2 = 0$$

$$x^2 = 1$$

$$\text{or } x = +1, -1$$

The points  $x = 1$  and  $x = -1$  divide the real line in three disjoint intervals i.e.,  $(-\infty, -1)$ ,  $(-1, 1)$  and  $(1, \infty)$

In interval  $(-1, 1)$ , it is observed that

$$x^2 < 1$$

$$1/x^2 > 1$$

$$\text{Or } 0 > 1 - 1/x^2 \quad (x \neq 0)$$

$f$  is strictly decreasing on  $(-1, 1)$

In intervals  $(-\infty, -1)$  and  $(1, \infty)$ , it is observed that:

$$x^2 > 1$$

$$1/x^2 < 1$$

$$1 - 1/x^2 > 0$$

$f$  is strictly increasing on  $(-\infty, -1)$  and  $(1, \infty)$

Hence, function  $f$  is strictly increasing in interval  $I$  disjoint from  $(-1, 1)$ .

Hence, the given result is proved.

### Question 16

Prove that the function  $f$  given by  $f(x) = \log \sin x$  is strictly increasing on  $(0, \pi/2)$

And strictly decreasing on  $(\pi/2, \pi)$

### Solution

$$f(x) = \log \sin x$$

$$f'(x) = (1/\sin x) \cos x = \cot x$$

In interval  $(0, \pi/2)$ ,  $f'(x) = \cot x > 0$

$f$  is strictly increasing in  $(0, \pi/2)$

In interval  $(\pi/2, \pi)$ ,  $f'(x) = \cot x < 0$

$f$  is strictly decreasing in  $(\pi/2, \pi)$

### Question 17

This material is created by <http://physicscatalyst.com/> and is for your personal and non-commercial use only.

Prove that the function  $f$  given by  $f(x) = \log \cos x$  is strictly decreasing on  $(0, \pi/2)$

And strictly increasing on  $(\pi/2, \pi)$

**Solution**

$$f(x) = \log \cos x$$

$$f'(x) = (1/\cos x) (-\sin x) = -\tan x$$

In interval  $(0, \pi/2)$ ,  $f'(x) = -\tan x < 0$

$f$  is strictly decreasing on  $(0, \pi/2)$

In interval  $(\pi/2, \pi)$ ,  $f'(x) = -\tan x > 0$

$f$  is strictly increasing on  $(\pi/2, \pi)$

**Question 18**

Prove that the function given by  $f(x) = x^3 - 3x^2 + 3x - 100$  is increasing in  $\mathbb{R}$ .

**Solution**

$$f(x) = x^3 - 3x^2 + 3x - 100$$

$$f'(x) = 3x^2 - 6x + 3 = 3(x-1)^2$$

For any  $x$  in  $\mathbb{R}$ ,  $(x - 1)^2 > 0$ .

Hence, the given function ( $f$ ) is increasing in  $\mathbb{R}$ .

**Question 19**

The interval in which  $y = x^2 e^{-x}$  is increasing is

(A)  $(-\infty, \infty)$

(B)  $(-2, 0)$

(C)  $(2, \infty)$

(D)  $(0, 2)$

**Solution**

$$y = x^2 e^{-x}$$

This material is created by <http://physicscatalyst.com/> and is for your personal and non-commercial use only.

$$dy/dx = 2x e^{-x} - x^2 e^{-x} = x e^{-x} (2-x)$$

for  $dy/dx=0$

$$x=0 \text{ or } x=2$$

The points  $x=0$  and  $x=2$  divide the real line into three disjoint intervals

i.e.,  $(-\infty, 0)$ ,  $(0, 2)$  and  $(2, \infty)$

In intervals  $(-\infty, 0)$ ,  $(2, \infty)$ ,  $dy/dx < 0$

$f$  is decreasing on  $(-\infty, 0)$ ,  $(2, \infty)$ ,

In interval  $(0, 2)$ ,  $dy/dx > 0$

$f$  is strictly increasing on  $(0, 2)$ .

Hence,  $f$  is strictly increasing in interval  $(0, 2)$ .

The correct answer is D.
